

Lab 4: Simple Queries

Due date: Tuesday, May 6, **midnight!**.

Lab Assignment

Assignment Preparation

This is an individual lab. Each student has to complete all work required in the lab, and submit all required materials **exactly as specified** in this assignment.

The assignment will involve writing SQL queries for different information needs (questions asked in English) for each of the five course datasets.

The Task

You are to write and debug (to ensure correct output) the SQL queries that return information as requested in each of the information needs outlined below. The information needs can be addressed with a simple SELECT statement (i.e., a SELECT statement without grouping, aggregation and nested subqueries) and/or with UNION, MINUS and INTERSECT statements.

For this assignment, you will prepare one SQL script for each database. In addition to SQL statements you may need to include some SQL*plus formatting instructions to ensure that your output looks good. In particular, every row of every resulting table must be printed in a single line. If that means changing the size of the line - do it. Similarly, there should not be awkward pagination of the answers - change page size as needed.

STUDENT dataset

For STUDENT dataset, write an SQL script containing SQL statements answering the following information requests.

1. Find all students who attend kindergarden. For each student list first and last name.
2. Find all grades represented in the database. Report each grade just once, sort grades in ascending order.
3. Find all students whose first name is **GAYLE**. Return the last name, the grade and the classroom for each of them.
4. Find all classrooms in which 4th grade is taught. Report each classroom exactly once. Report classrooms in ascending order.
5. Find all students taught by **JERLENE NIBLER**. Output first and last names of students.
6. Find all teachers who teach Kindergarden. Report first and last name of each teacher (each name to be reported once).
7. For each teacher, report the grade (s)he teaches. Each name has to be reported exactly once. Sort the output in ascending order by grade.

BAKERY dataset

Write an SQL script containing SQL statements answering the following information requests.

1. Find all cookies on the menu. For each item output the flavor, the name (food type) of the item, and the price. Sort your output in ascending order by price.
2. Find all pastries that are not cookies whose price is between \$1.00 and \$1.30. Output the flavor, the name of the pastry and the price. Sort your output in ascending order by price.
3. Find all dates on which a **Lemon Tart** was purchased. Report just the dates (each date - once) in ascending order.
4. Find all customers who purchased '**Chocolate Croissant**'. Output only the first and the last names of the customers and the date of purchase (thus if the same customer purchased chocolate croissant on different occasions, his/her name will be reported twice). Sort by the last name of the customer.
5. Find all types of pastry purchased by **TRAVIS ESPOSITA**. Each pastry type (flavor, food) is to be listed once. Order output by the type of pastry (**food**).
6. Find all customers who made a purchase on October 2, 2007. List just their names.
7. Find all dates on which **RUPERT HELING** made multiple purchases. Report each date exactly once, output dates sorted in ascending order.

8. Find all customers who purchased (at some point in time, possibly during different trips to the bakery) both a **Chocolate Croissant** and a **Vanilla Eclair**. Output first and last names of each customer. (each name must be reported once).

CARS dataset

1. Find all 6-cylinder cars produced in 1982. For each car report its full name (e.g., 'plymouth fury iii') and acceleration. The list should be displayed in ascending order by acceleration.
2. Find all 4-cylinder cars that accelerate from 0 to 60mph in 12.5 seconds or less produced in the 1970s. For each car report its full name and year or production, acceleration time and horsepower.
3. Find all cars with better gas mileage and smaller horsepower than the 1978 'ford fiesta'. Output the full name and year or production, horsepower and gas mileage for each car.
4. List all 1977 cars produced by 'Ford Motor Company'. Output just the full names of the cars.
5. Find all European car makers which produced at least one light (weight less than 2000lbs) car between 1974 and 1979 (inclusively). Output the full name of the company and its home country. Each company should be reported just once.
6. Find all 6-cylinder cars produced in Europe. Report the full name of the car, the year it was produced and the name of the maker.

CSU dataset

Here are the queries for the CSU dataset.

1. For each year between 1995 and 2004 (inclusive) report the number of students who graduated from Cal Poly (Pomona). Output the year and the number of graduates. Sort output by year.
2. Find all years in which the number of graduates from Sonoma State University exceeded the number of graduates from Humboldt State University. Output the years, and the respective numbers of degrees granted for each of the two campuses. (here we assume "graduates" = "degrees granted").
3. Report total (both undergraduate and graduate) enrollments in 'Mathematics' disciplines for each Los Angeles, Ventura and San Luis Obispo county campus in 2004. Output the full name of the campus, the country it resides in and the enrollment. Sort the output in ascending order by the enrollment.

4. Find campuses where the faculty FTE has increased in two consecutive years. Report the full campus name, and the two consecutive years and the FTEs for each of them. (Note, if such decrease in FTEs happened on a single campus more than once, report all such occurrences). Sort the output in ascending order by the first of the pair of years.
5. List all campuses where campus fees in 2006 were greater than those at San Jose State University. For each campus, list its full name and the fee amount. Sort the output by the fee amount.
6. For each campus with enrollment (use student enrollment FTE) over 15,000, report the student to faculty ratio in 2002. (Use the student enrollment FTE and the faculty FTE for the year.) Output the full name of the campus, student enrollment, faculty size and the student-to-faculty ratio. Output in ascending order by the computed ratio.

MARATHON dataset

For this dataset, all times must be output in the same format as in the original dataset (in the file `marathon.csv`).

1. Find the results of all male runners from the '40-49' age group from DARTMOUTH, MA. Output first and last name, town/city name, their place in the group and their time.
2. Find the results for all 44-year female old runners. For each runner, output name (first, last), town, state, time running and gender. Sort by gender, then by time.
3. Find all women who ran the race faster than the race participant with Bib number 284.
4. List all runners who took first place in their respective age/gender groups. For each runner, output name (first, last), age, gender, age/gender group, and overall place in the race.

AIRLINES dataset

1. Find all airlines that have at least one flight out of ALX airport. Report the full name and the abbreviation of each airline. Report each name only once.
2. Find all airlines that have at least one flight to TDW airport. Report the full name and the abbreviation of each airline. Report each name only once.
3. Find all airlines that have at least one flight from ALX airport and at least one flight to TDW airport. Report the full name and the abbreviation of each airline. Report each name only once.

4. Find all airlines that have at least one flight between ANP and ANY airports. Report the full name and the abbreviation of each airline. Report each name only once.
5. Find all airports with a direct flight from ANY airport. For each airport report its full name and the airport code.
6. Find all airports no direct flight from ANY airport. For each airport report its full name and the airport code.
7. We want to fly from ANY airport to ASY airport with just a single connection. Find the list of connecting airports (i.e. airports that have a flight from ANY and a flight to ASY). For each airport report its full name and the airport code. Report each airport only once.
8. We want to fly from ANY airport to ASY airport with just a single connection. For each such connection, specify the names of the airlines for each of the flights.

Submission Instructions

You must submit all your files in a single archive. Accepted formats are gzipped tar (.tar.gz) or zip (.zip). The file you are submitting must be named lab4-*ilastname*.ext, where *i* stands for the initial of your first name, and *lastname* is your last name. E.g., if I were submitting this file, the name would be lab4-adekhtyar.zip or lab4-adekhtyar.tar.gz.

The archive shall contain six directories: AIRLINES, CARS, CSU, BAKERY, STUDENTS and MARATHON.

Each directory shall contain the following SQL scripts:

- Database creation script. (e.g., CARS-setup.sql). Use the scripts from Lab 2 and (for MARATHON) Lab 3 submissions.
- Table creation script. cat all <DATASET>-build-<table>.sql scripts together into one big script. Name it <DATASET>-insert.sql (e.g., CARS-insert.sql).
- The cleanup script (e.g., CARS-cleanup.sql). Use the scripts from Lab 2 and Lab 3.
- **NEW script.** One script per database, containing all SQL statements and any SQL*plus statements needed for formatting. Name the script <DATASET>-info.sql (e.g., CARS-info.sql).
