

## Lab 7: Full Power of SQL

**Due date:** Monday, March 9, **midnight**.

**Note:** Lab 8 will be assigned on Thursday, March 5.

## Lab Assignment

### Assignment Preparation

This is an individual lab. Each student has to complete all work required in the lab, and submit all required materials **exactly as specified** in this assignment.

The assignment will involve writing SQL queries for different information needs (questions asked in English) for each of the course datasets.

### The Task

You are to write and debug (to ensure correct output) the SQL queries that return information as requested in each of the information needs outlined below. The information needs may be quite complex and to address them, the use of aggregation, grouping, nested queries or their combinations may be required.

For this assignment, you will prepare one SQL script for each database. Each information need has to be addressed with a *single SQL statement*, but the statement can have multiple levels of nesting, grouping and aggregation, and use the UNION operation.

**Note:** In this lab, we use only eight databases. There are no queries for the AIRLINES database.

**Filenames.** For each dataset, you will create a SQL script called <DATASET>-queries.sql. E.g., for the CARS dataset, your SQL script with the SQL SELECT statements is CARS-queries.sql.

## **STUDENTS database**

For STUDENT dataset, write an SQL script containing SQL statements answering the following information requests.

1. Find the grade(s) with the largest number of classrooms. Report the grade and the number of classrooms in it.
2. Find the classroom(s) with the smallest number of students. Report the classroom, the teacher (first name, last name) and the number of students.
3. Find how many classrooms have the number of students that exceeds the average number of students per classroom. Report just the number.
4. Find all grades in which the number of students is smaller than the number of students in fifth grade. Report just the grades.
5. Find all pairs of classrooms with the same number of students in them. Report each pair only once. Report both classrooms and the number of students. Sort output in ascending order by the number of students in the classroom.

## **BAKERY database**

Write an SQL script containing SQL statements answering the following information requests.

1. Find the customer(s) who spent the most on pastries in October of 2007. Report first and last name.
2. Find the customers who never purchased an eclair ('Eclair') (in October of 2007). Report their first and last names in alphabetical order by last name.
3. Find the type of baked good (food type, flavor) responsible for highest total revenue.
4. Find the most popular (by number of pastries sold) item. Report the item (food, flavor).
5. Find the day of the highest revenue in the month of October, 2007.
6. For every customer who DID NOT make a purchase on the day of the highest revenue, report the total number of purchases (overall) the customer made and the last date of a purchase. Order the output by the total amount of purchases.

7. for every type of **Croissant** report the customer(s) who purchased it the largest number of times during the month of October 2007. Report the name of the pastry (flavor, food type), the name of the customer (first, last), and the number of purchases made. Sort output in descending order on the number of purchases, then in alphabetical order by last name of the customer.
8. Output the names of all customers who did not make a purchase between October 20 and October 24 (inclusive) of 2007. Output first and last names in alphabetical order by last name.
9. Output the names of all customers who made multiple purchases (more than one receipt) on the latest day in October on which they made a purchase. Report names (first, last) of the customers and the earliest day in October on which they made a purchase, sorted in chronological order.
10. Find which types of cakes were never purchased on Mondays. Report full description (flavor, food) in alphabetical order.

### **CARS database**

1. Report all vehicles with the best acceleration. For each vehicle, report its full name and the year of production.
2. Among the vehicles with the best acceleration, report the most powerful (horsepower) one. Report full name and the year of production.
3. Find the automaker that produced multiple vehicles in 1976, whose 1976 vehicles had the best average gas milage. Report the automaker, the number of vehicle models it produced in 1976 and the average gas milage. (Note: exclude automakers with a single vehicle in 1976 from consideration completely).
4. For each year find the automakers whose models for that year had the best average gas milage. Report the year, the automaker, the number of models produced that year and the average gas milage. Present the output in chronological order.
5. Find the most fuel-efficient 8-cylinder model. Report the full name of the car, the year it was produced and the home country of its maker.
6. Find the difference in gas milage between the most fuel-efficient 8-cylinder model and the least fuel-efficient 4-cylinder model. Report just the number.
7. For each country report the number of 4-cylinder models its companies have produced in the 1970s which have higher horsepower than some 8-cylinder model also produced in the 1970s. (note, the 8-cylinder model can come from any country and any company).

## CSU database

Here are the queries for the CSU dataset.

1. Find the campus with the largest enrollment in 1959. Output the name of the campus and the total undergraduate enrollment.
2. Find the university that granted the largest total number of degrees over the entire recorded history. Report the name of the university and the total number of degrees.
3. Find the university with the best (smallest) student-to-faculty ratio in 2003. Report the name of the campus and the student-to-faculty ratio. Use FTE numbers for the enrollment.
4. Find the university with the largest percentage of the undergraduate student body in the engineering discipline in 2004. Output the name of the campus and the percent of the engineering students on campus.
5. For each year between 1998 and 2003 (inclusive) report the campus with the highest relative increase in enrollment from previous year. Output the year and the campus name.

Note: if a university started accepting students in year  $n \geq 1998$  for the first time, information about this university need not be captured in the process of determining the campus with the best relative increase in enrollment for year  $n$ . That is: only consider a campus in year  $n$  if it enrolled students in year  $n - 1$ .

6. For each year between 1997 and 2003 (inclusive) find the university with the best (highest) total degrees granted to total enrollment (use enrollment numbers) ratio. Report the years, the names of the campuses and the ratios in chronological order.
7. For each university with an undergraduate engineering program in 2004 (i.e., with a non-zero number of engineering undergraduates) report the year of the lowest student-to-faculty ratio (use enrollment FTE and faculty FTE numbers). Output campus name, year and the ratio in alphabetical order by campus name.

## INN database

1. Find the least popular room in the hotel. The least popular room is the room that had seen the lowest number of reservations (Note: if there is a tie for the least popular room status, report all the least popular rooms). Report the full name of the room, the room code and the number of reservations.

2. Find the room that has been occupied the most based on the reservations in the database<sup>1</sup>. Report the room name, room code and the number of days it was occupied.
3. Find the most expensive reservation(s) made. Report the room name (full), dates of stay, last name of the person who made the reservation, daily rate and the total amount paid.
4. For each room, report the most expensive reservation. Report the full room name, dates of stay, last name of the person who made the reservation, daily rate and the total amount paid. Sort the output in descending order by total amount paid.
5. Find the best month (i.e., month with the highest total revenue). Report the month, the total number of reservations and the revenue. For the purposes of the query, count the entire revenue of a stay that commenced in one month and ended in another towards the earlier month. (e.g., a September 29 - October 3 stay is counted as September stay for the purpose of revenue computation).
6. For each room report whether it is occupied or unoccupied on October 22, 2010. Report the full name of the room, the room code, and put either 'Occupied' or 'Empty' depending on whether the room is occupied on that day. (the room is occupied if there is someone staying the night of May 19, 2010. It is NOT occupied if there is a checkout on this day, but no checkin). Output in alphabetical order by room code.
7. For each room report how many reservations were made for the most expensive rate for that room. Report full room name and the appropriate number of reservations. Sort the output in ascending order by the number of reservations.

## MARATHON database

For this dataset, all times must be output in the same format as in the original dataset (in the file `marathon.csv`).

1. Find the state with the largest number of participants.
2. Find all towns in Massachusetts (MA) which fielded more female runners than male runners for the race. Report the names of towns.
3. Find all people from SOUTHBORO, MA who ran better than at least one runner from the state of Missouri. Output the name (first, last) of each runner, their hometown and state and the overall place in the race.
4. Find all towns in Massachusetts (MA) all female runners from which had better than the average pace in the race. Report town names.

---

<sup>1</sup>No need to limit the number of occupied days to 2010.

## **WINE dataset**

1. Find the grape(s) that grow(s) in the largest number of appellations. Report grape name, color and the number of appellations it grows in.
2. Find the most popular white grape (i.e., the grape that is used to make the largest number of white wines in the database). Report the name of the grape.
3. Report the grape with the largest number of high-ranked wines (score of 93 and above).
4. Report the appellation responsible for the largest number of high-ranked wines (score of 93 and above). Report just the name of the appellation.
5. Find the high-ranked wine (score of 93 or above) responsible for highest sales revenue. Report the vintage year, winery, wine name, score and the computed revenue.
6. Find if there are any 2008 Chardonnays that scored better than any 2007 Syrah. report winery, wine name, appellation, score and price.
7. Two California AVAs, Carneros and Dry Creek Valley have a bragging rights contest every year: the AVA that produces the highest-ranked wine among all the wines produced in both AVAs wins. Based on the data in the database, output (as a single tuple) the number of vintage years each AVA has won between 2005 and 2009 (you want the output to look like a score of a game between the two AVAs. Only the vintage years where one AVA won count - vintages when both AVAs had the same highest score should not be counted).
8. Find how many cases were produced of the most expensive red wine from San Luis Obispo county.

## **KATZENJAMMER dataset**

1. Report the first name of the performer who never played guitar.
2. Report, in alphabetical order (if more than one song returned), the titles of all instrumental compositions performed by Katzenjammer ("instrumental composition" means no vocals).
3. Report the title (or titles) of the song(s) that involved the largest number of instruments played by all performers combined (if multiple songs, report the titles in alphabetical order).
4. Find the favorite instrument of each performer. Report the first name of the performer, the name of the instrument and the number of songs the performer played the instrument on. Sort in alphabetical order by the first name.

5. Find all instruments that ONLY Sloveig played. Report instruments in alphabetical order.
6. Report the first name of the performer who played the largest number of different instruments.
7. Report the performer(s) who sang lead on the largest number of songs while not being positioned in the center of the stage. If more than one performer is returned, report their first names in alphabetical order.

## Submission Instructions

You must submit all your files in a single archive. Accepted formats are gzipped tar (.tar.gz) or zip (.zip). The file you are submitting must be named lab7.ext, where ext is either zip or tar.gz.

The archive shall contain eight directories: CARS, CSU, BAKERY, INN, STUDENTS, WINE, KATZENJAMMER and MARATHON. (you can submit AIRLINES directory, it will be ignored.)

Each directory shall contain the following SQL scripts:

- Database creation (<DATABASE>-setup.sql), database population (<DATABASE>-insert.sql) and database cleanup (<DATABASE>-cleanup.sql) scripts from Lab 4.
- **NEW script.** One script per database, containing all SQL statements. Name the script <DATASET>-queries.sql (e.g., CARS-queries.sql).

**Note:** Please do not use any tee commands in your scripts.

Submit:

Section 1:

```
$handin dekhtyar lab07-01 <file>
```

Section 3:

```
$handin dekhtyar lab07-04 <file>
