/****
 *
 * Class CalendarTool is the top-level model class for the regular-user
 * Calendar Tool program.  CalendarTool has references to the functional model
 * classes of the tool: File, Edit, Schedule, View, Admin, Options, and Help.
 * There is also a reference to the CalendarDB class that houses the tool's
 * major data bases.
 *                                                                          <p>
 * The CalendarTool class also has the main method for the program.  This
 * method contructs the top-level model, view, and process classes.  It then
 * shows the top-level UI and let's the Java event loop take it from there.
 *                                                                          <p>
 * Functionalitywise, all of the model classes are autonomous units.  They each
 * do their own work as invoked by the user.  All that this top-level class
 * does is to construct the work-doing model classes and set up the initial
 * state of the tool when it is invoked from the outside operating system.
 *                                                                          <p>
 * See also the companion view class <a href= "caltool_ui/CalendarToolUI.html">
 * CalendarToolUI. </a>
 *                                                                          <p>
